Python Programming Lab Sheet

Practical Code Execution and Output Verification | Source Files: case 1.py, case 2.py, case 3.py

Case 1: Electricity Bill Calculation

case 1.py

```
units = int(input("Enter electricity units: ")) if units <= 100: bill = units * 2 elif units <= 200: bill = 100 * 2 + (units - 100) * 3 else: bill = 100 * 2 + 100 * 3 + (units - 200) * 5 print("Electricity Bill =", bill)
```

```
PS C:\Users\DELL\python> python case 1.py
Enter electricity units: 90
Electricity Bill = 180
```

Case 2: Salary Slip Generator

case 2.py

```
basic = float(input("Enter basic salary: ")) allowance = basic * 0.20 deduction = basic * 0.10 gross = basic + allowance net = gross - deduction print("Basic Salary =", basic) print("Allowance =", allowance) print("Deduction =", deduction) print("Gross Salary =", gross) print("Net Salary =", net)
```

```
PS C:\Users\DELL\python> python case 2.py
Enter basic salary: 2000
Basic Salary = 2000.0
Allowance = 400.0
Deduction = 200.0
Gross Salary = 2400.0
Net Salary = 2200.0
```

Additional Program Cases & IDE Screenshots

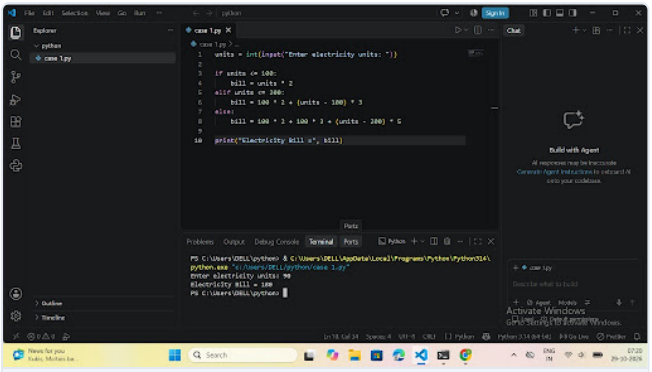

Case 3: Inventory Stock Management

case 3.py

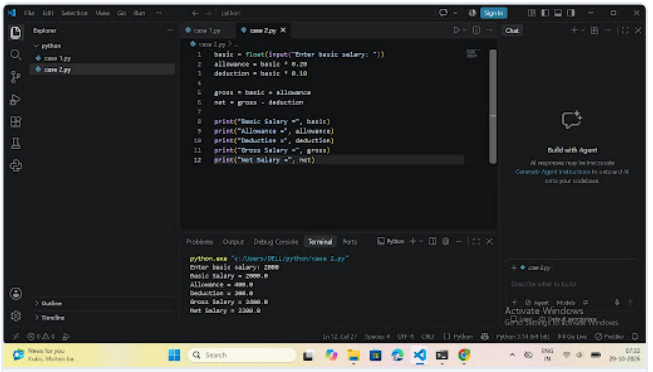

```
opening = int(input("Enter opening stock: ")) received = int(input("Enter received stock: ")) dispatched = int(input("Enter dispatched stock: ")) closing = opening + received - dispatched print("Opening Stock =", opening) print("Received Stock =", received) print("Dispatched Stock =", dispatched) print("Closing Stock =", closing) if closing < 0: print("Error: Stock shortage")
```

```
PS C:\Users\DELL\python> python case 3.py
Enter opening stock: 100
Enter received stock: 20
Enter dispatched stock: 79
Opening Stock = 100
Received Stock = 20
Dispatched Stock = 79
Closing Stock = 41
```
